Milestone 1  
Nate McGrew

I'm building the web-app by myself. So far, I've decided to use node.js and MongoDB on the back end instead of SQL. I feel like node will be much simpler to use than java, even though I know java better, because node seems better suited for building web-apps. In talking with more experienced developers and reading on my own, I've learned that Mongo works better with node than SQL. I'm also excited for the opportunity to learn new technologies and increase/broaden my skills as a developer. So far, I don't have any code written, but I have been reading tutorials on node and Mongo, and hopefully I'll have a working server uploaded soon.

If I have time, I'd still like to build the front end using Angular, but I may use straight javascript with html and css to save the time spent on learning another technology.
